

*IUPAC-AOCS Workshop on Fats, Oils & Oilseeds Analyses & Production*  
*December 6-8, 2004*  
*Tunis, Tunisia*

**CHEMICAL vs ENZYMATIC INTERESTERIFICATION**

**Wim De Greyt**  
**De Smet Group Belgium**

# INTERESTERIFICATION : chemical vs enzymatic

- **CHEMICAL** : - 'Random' Interesterification  
(FA-distribution according to law of probability),  
- Preferred catalyst:  $\text{CH}_3\text{ONa}$  (powder)

- **ENZYMATIC** : - Lipase catalysed  
- Lipozyme TL IM (immobilised)  
- 'Selective' FA-interchange on sn-1,3 positions

# INTERESTERIFICATION : PAST SITUATION

- **CHEMICAL INTERESTERIFICATION**

- High oil losses (up to 5%, due to 'wet' catalyst inactivation)
- Risky operation (related to use of catalyst : e.g. Na/K alloys)
- Largely replaced by partial hydrogenation  
(UFA vs SFA, *Trans* Fatty acids was not an issue)

- **ENZYMATIC INTERESTERIFICATION**

- Expensive catalysts, low activity and stability, high operating cost
- Only used for high value-added products (CBE, structured lipids)

# INTERESTERIFICATION : CURRENT SITUATION

Increasing trend to reduce / exclude *trans* fatty acids from food

→ **because of stricter legislation**

- *trans* labelling in USA from 2006
- very strict Danish regulation : max. 2% in food fats

→ **increasing pressure from consumer organisations**

Don't partially hydrogenate me™  
[www.bantransfats.com](http://www.bantransfats.com)

Increasing trend to avoid chemicals in food processing

Major USA food producers (Mc Donalds, Fritolay, Nabisco,...)  
are replacing *trans* fats by low /zero TFA alternatives

# INTERESTERIFICATION : CURRENT SITUATION

Increased demand for :

low *trans* products: < 5% on fat basis

zero *trans* products: <0.5% on fat basis

INTERESTERIFICATION has become **the alternative fat modification technology** to PARTIAL HYDROGENATION

**Past** : Chemical interesterification for commodity fat blends  
Enzymatic for 'specialty' fats (SUS fats)

**Today** : Cost-effective enzymatic IE for commodity fats

# The **Trans Fat** **SOLUTION**

**Cooking and Shopping to Eliminate  
the Deadliest Fat from Your Diet**

## CHEMICAL INTERESTERIFICATION

# CHEMICAL INTERESTERIFICATION: PRINCIPLE

# CHEMICAL INTERESTERIFICATION CATALYSTS

Type of catalyst	Concentration %	Temperature °C	Time min
Na, K, Na-K alloys	0.1-1	25-270	1-120
<b>CH<sub>3</sub>ONa, C<sub>2</sub>H<sub>5</sub>ONa</b>	<b>0.05-1</b>	<b>50-120</b>	<b>30-60</b>
NaOH, KOH	0.5-2	150-250	90
NaOH + Glycerol	0.05-0.1	60-160	30-45
Sodium stearate	0.5-1	250	60
NaH, NaNH <sub>2</sub>	0.2-2	170	3-120

## CHEMICAL INTERESTERIFICATION CATALYST : $\text{NaOCH}_3$

- Trivial names: **Sodium methoxide; Sodium methylate**
- **Very alkaline catalyst (stronger than NaOH)**
- **Very reactive : exothermic decomposition into NaOH and  $\text{CH}_3\text{OH}$  in presence of moisture**
- **Hazardous product, requiring carefull handling and controlled storage**
- **Available in powdered form for interesterification, or dissolved in MeOH (25%) for biodiesel production**
- **Supplied in plastic bags (10kg) sealed in drums**

# CATALYST INACTIVATION

Type	Poison	Catalyst inactivated (% on oil)		
	level	Na	CH <sub>3</sub> ONa	NaOH
Water	0.01 %	0.013	0.03	
fatty acid	0.05 %	0.004	0.01	0.007
peroxide	1.0	0.0023	0.0054	0.004
total catalyst inactivated		0.0193	0.0454	0.0011

Feedstock Oil needs to be very dry and low in FFA

## CHEMICAL INTERESTERIFICATION : OIL QUALITY

Chemical  $\longrightarrow$  semi-refined (neutralized and bleached)

Physical  $\longrightarrow$  fully refined (bleached and steam refined)

<b>FFA :</b>	<b>&lt; 0.05 %</b>
<b>Phosphorus :</b>	<b>&lt; 2 ppm</b>
<b>Moisture :</b>	<b>&lt; 100 ppm</b>
<b>Peroxide value :</b>	<b>&lt; 0.5 meq/kg</b>
<b>p-Anisidine value :</b>	<b>&lt; 10</b>

# CHEMICAL INTERESTERIFICATION : OIL DRYING

## Physical equilibrium of water in oil (ppm)

Temp	5 mbar	10 mbar	25 mbar	50 mbar	75 mbar
75°C	31	63	156	310	469
100°C	17	34	85	171	256
125°C	10	21	53	105	158
150°C	7	14	36	72	108
175°C	6	12	30	60	90

In practice: equilibrium not reached

125°C - 25 mbar - 60 min gives 80 ppm water

# INTERESTERIFICATION PROCESS

## ADDITION OF THE CATALYST

- Addition of 0.05-0.1%  $\text{NaOCH}_3$
- 'Aggressive' catalyst
- Avoid direct contact

**Automatic dosing**

**Catalyst dry storage tank**

**Rotary dosing valve**

**Catalyst dosing tank**

## START OF THE REACTION

- Formation of deep red-brownish color
- Usually appears shortly after catalyst addition (few minutes)

# INTERESTERIFICATION PROCESS

## PROLONGATION OF THE RANDOMISATION

- Randomisation usually occurs quite fast (10-15 min.)
- Industrially reaction time is longer : 30-60 min.
- No quick on-line method to check completion/status of the reaction
- Once 'Randomization' is reached, reaction will continue (until destruction of catalyst), but with no 'net' effect
- Too long reaction will darken oil & give color fixation

# CHEMICAL INTERESTERIFICATION : OIL LOSSES

- Side reactions leading to oil losses (catalyst related)

→ 1 mole  $\text{NaOCH}_3$  gives 1 mole FAME & 1 mole Na-soap

1 mole FFA ← acid catalyst inactivation

→  $\% (\text{FAME} + \text{FFA}) = \pm 10 * \% \text{NaOCH}_3 \text{ added}$

- Oil loss during postbleaching =  $0.3 * \% \text{bleaching earth}$
- Oil loss during deodorisation =  $\pm 1.3 * \% (\text{FFA} + \text{FAME})$

0.1% of  $\text{NaOCH}_3$  catalyst

0.5% bleaching earth

Overall oil loss : min. 1.5%

# CHEMICAL INTERESTERIFICATION : PROCESS STAGES

1. Neutralisation: FFA  $\xrightarrow{\text{NaOH}}$  FA soaps (no removal)
2. Drying:  $\text{H}_2\text{O} < 100 \text{ ppm}$ ; preferably  $< 50 \text{ ppm}$   
 $120^\circ\text{C}$ ;  $< 20 \text{ mbar}$
3. Reaction with catalyst:  $90\text{-}100^\circ\text{C}$  during 30 min. at 20 mbar  
max. 0.1 %; preferably 0.05% catalyst
4. Reaction stop: water / acid / acid activated silica
5. Bleaching : 0.2-0.5% Bleaching earth
6. Deodorising:  $220\text{-}230^\circ\text{C}$  (deodo) /  $240\text{-}250^\circ\text{C}$  (stripping)

# CHEMICAL INTERESTERIFICATION : SIDE REACTIONS

$\text{NaOCH}_3$  : strong 'alkaline' catalyst

→ will catalyze also unwanted side-reactions

-Degradation of tocopherols

-Formation of tocopherol esters

-Formation of di-alkylketones

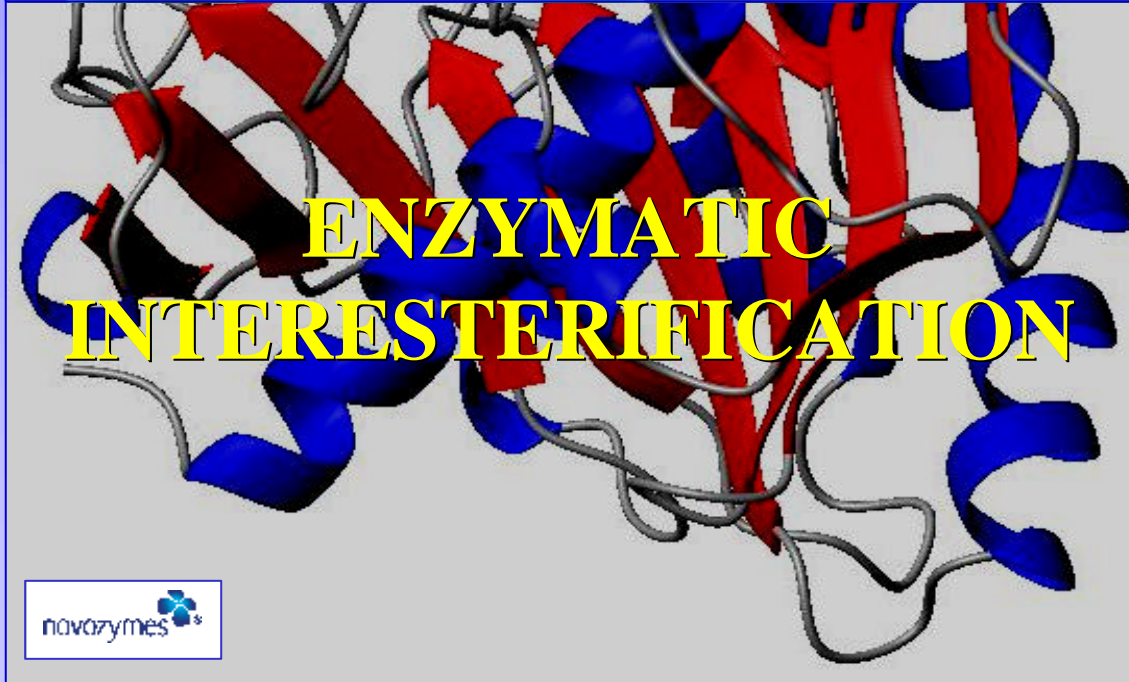

-Some formation of phytosterol esters

→ May affect oxidative stability

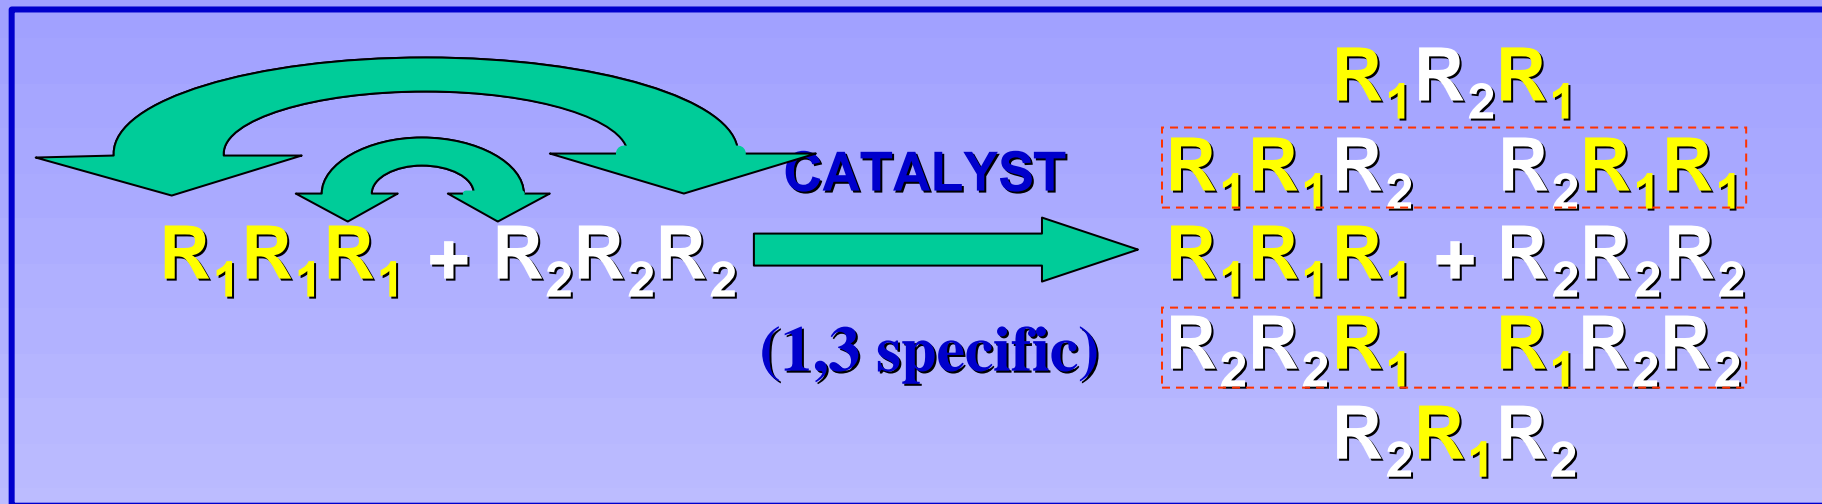

→ more side products at higher catalyst conc. & temperature

max. catalyst conc. : 0.1% - max. temperature : 120°C

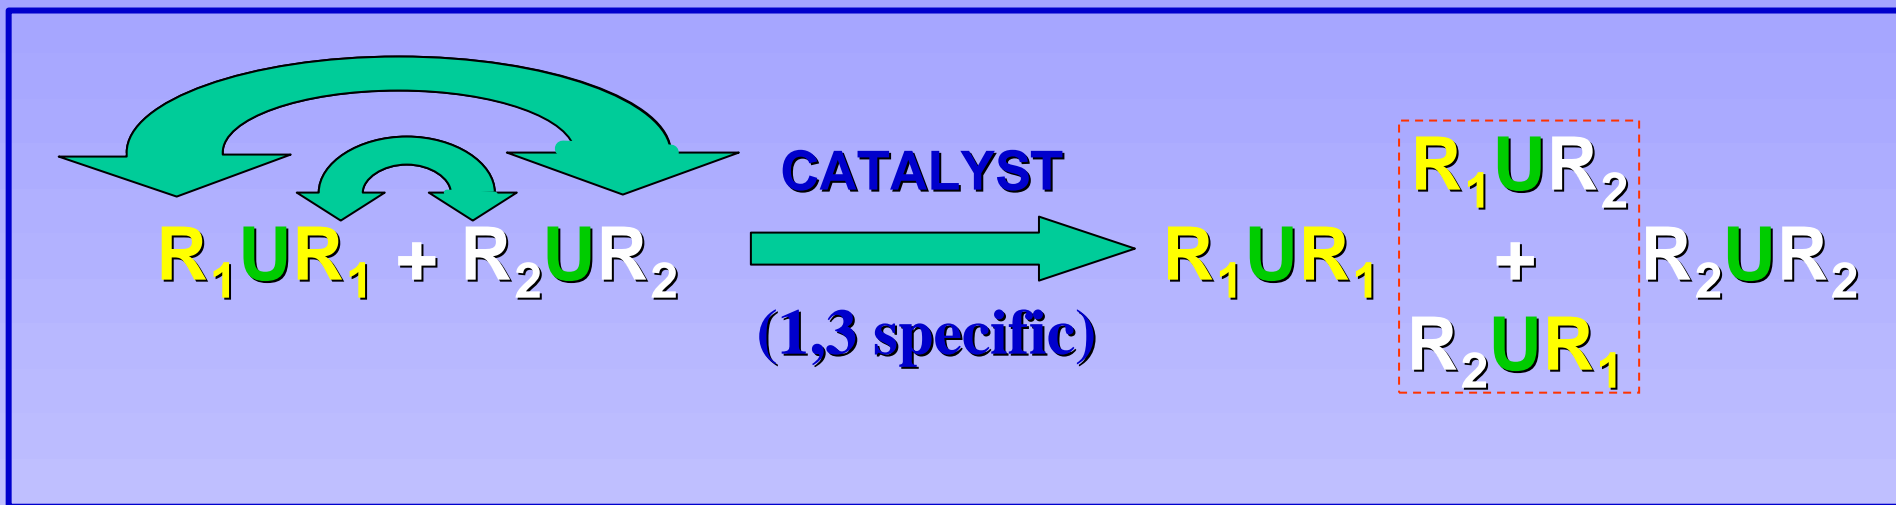

# ENZYMATIC INTERESTERIFICATION: PRINCIPLE

# ENZYMATIC INTERESTERIFICATION OF SUS FATS : PRINCIPLE

# ENZYMATIC INTERESTERIFICATION

## Enzyme : LIPOZYME TL IM

- Triacylglycerolhydrolase (also named Lipase)
- Lipase from *Thermomyces lanuginosus*. (in past from pancreas)
- sn-1,3 specific and heat stable (max. temp. : 75° C)
- HALAL approved

## Immobilized

- For use in fixed bed processes
- No enzyme in finished oil product
- Enables re-use of enzyme for better process economy
- Stabilizes the enzyme

# ENZYMATIC INTERESTERIFICATION

Enzyme : LIPOZYME TL IM

Enzyme inactivation due to : (stability)

Process temperature (max. 70°C)

Radicals (Peroxides)

Polar impurities (phosphatides, soaps

Secondary oxidation products : ketons, aldehydes...

Trace elements (e.g. Nickel)

Quality of Incoming oil is important : degummed - bleached-(deodorised)

# ENZYMATIC INTERESTERIFICATION

Enzyme : LIPOZYME TL IM

Enzyme productivity : kg EIE oil/kg enzyme

Depending on incoming oil quality

For good quality oil : min. 2500 kg EIE oil/kg enzyme

Productivity up to 4000 kg EIE oil/kg enzyme in pilot tests

Enzyme activity – Flow rate

Slow reaction : 1-2 kg IE oil/kg enzyme.hr

Enzyme in use for min. 2500 h (> 100 days)

# ENZYMATIC INTERESTERIFICATION : PROCESS ISSUES

Batch vs Continuous (fixed bed) process

Single or Multiple fixed bed reactor

Multiple fixed bed reactor placed in series or in parallel

Flow rate : variable or constant

Process control - Control of enzymatic conversion

Cross-contamination

# ENZYMATIC INTERESTERIFICATION : PROCESS ISSUES

## CHEMICAL INTERESTERIFICATION → BATCH

- Production of a large number of (small) batches
- Low degree of cross-contamination

## ENZYMATIC INTERESTERIFICATION → CONTINUOUS

- Limited cross-contamination (plug flow)
- Less suitable in case of many stock changes
- More suitable for alternative approach :  
Production of larger batches of 'bulk' EIE, followed by  
dry fractionation/blending to fine-tune properties

# ENZYMATIC INTERESTERIFICATION : OPERATION

## SINGLE FIXED BED REACTOR

- Enzyme Activity decreases over time
- Flow to be adjusted to maintain conversion
  - Max. Initial flow :10 kg IE oil / kg catalyst.hr (blend dependent)
  - Regular analyses of the conversion required
  - Low production rate at the end of the enzyme's lifetime

# ENZYMATIC INTERESTERIFICATION : OPERATION

## MULTIPLE FIXED BED REACTORS IN SERIES

- **Different enzyme activity in each reactor**
  - Lowest enzyme activity in first reactor : **GUARD EFFECT**
  - Highest enzyme activity in last reactor
  - Average production rate : **1-2 kg IE oil / kg enzyme.hr**

# ENZYMATIC INTERESTERIFICATION : OPERATION

## MULTIPLE FIXED BED REACTORS IN SERIES

- **GUARD EFFECT : only when reactors are in series**
  - Absorption of 'harmful' components on (partially spent) enzyme (reactor 1)
  - Protection of more active enzyme in further reactors
  - Longer life time and higher productivity
  - Difficult to quantify

# Process Comparison Chemical vs. Enzymatic Interesterification

➔ Less steps with enzymatic process

## Chemical interesterification

Prof. Batch Process

## Enzymatic interesterification

Prof. Continuous process

## Pilot enzymatic interesterification reactors with different enzyme capacities

Single stage : 1 x 10 kg - 1 x 100 kg

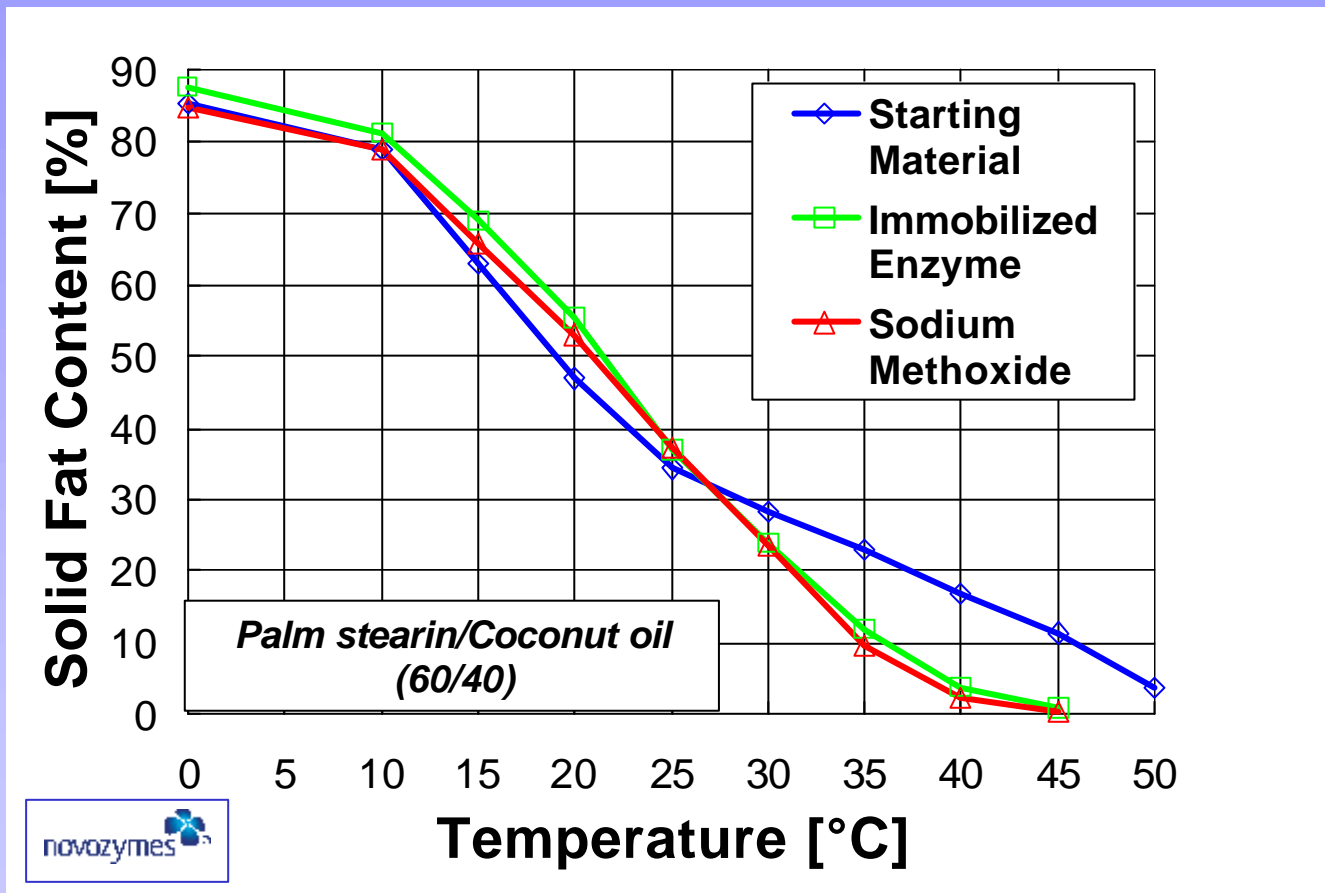

Multiple stage :

4 x 10 kg - 4 x 25 kg

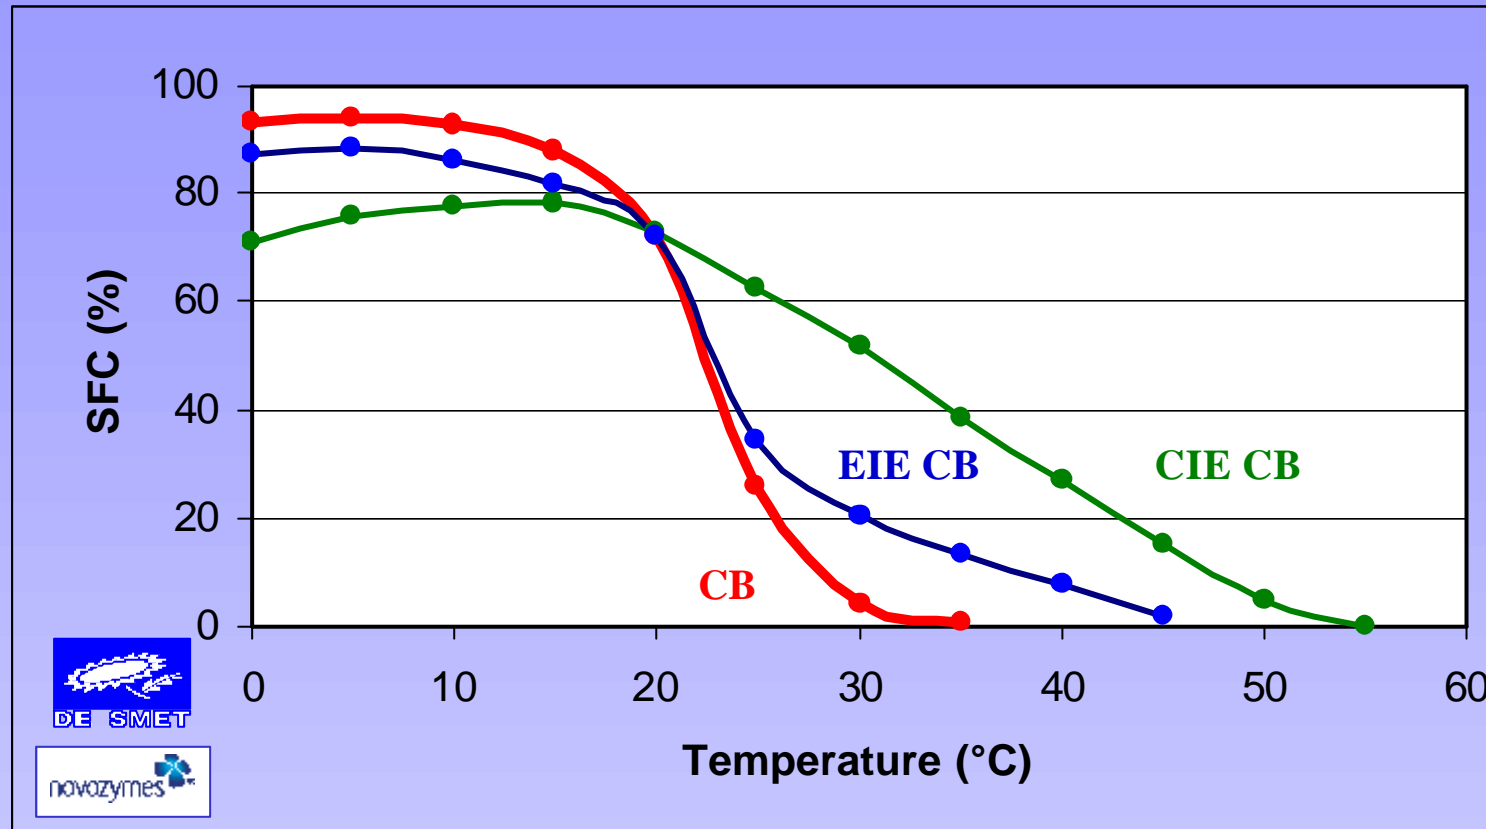

# Specific control of melting profile

Being able to control the melting characteristics, enzymatic interesterification can produce fat with physical properties similar to fat produced using chemical interesterification.

# Interesterification of cocoabutter (high SUS fat)

## Effect Chemical vs enzymatic I.E. on oil quality

PS / SFO	10/90			20/80			30/70			40/60			50/50		
	Feed	Chem	Enz	Feed	Chem	Enz	Feed	Chem	Enz	Feed	Chem	Enz	Feed	Chem	Enz
Color															
Yellow	11	15	10	15	10	9	16	11	8	19	16	8	19	18	10
Red 51/4	1.0	2.0	1.0	1.2	2.3	0.9	1.8	2.2	1.2	2	3	1.4	2.1	3.4	1.0

Tocopherol (ppm)	701	252	505	639	197	412	581	281	426	546	185	425	463	182	366
------------------	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

DAG (%)	1.5	3.9	2.0	1.7	3.7	3.0	1.9	4.5	3.5	2.14	4.2	3.0	2.4	4.9	3.5
Trans fats (%)	0.50	0.67	0.75	/	/	/	0.50	0.62	0.61	/	/	/	/	/	/

- EIE oil has a lighter colour than CIE oil (after pretreatment)
- EIE oil has a higher tocopherol content than CIE oil
- EIE oil has a lower diglyceride content than CIE oil

# ENZYMATIC vs CHEMICAL INTERESTERIFICATION

## + CHEMICAL INTERESTERIFICATION

Fully random : final product determined by FA comp of blend,  
not by triglyceride composition

Highly reproducible and cost-effective

Easy Process (batch)

## - CHEMICAL INTERESTERIFICATION

Hazardous catalyst: safe handling required

Side reactions can occur (at high catalyst conc./temp.)

Risk of flavor reversion & reduced stability

Loss of valuable minor-components (e.g. tocopherols)

# ENZYMATIC vs CHEMICAL INTERESTERIFICATION

## + ENZYMATIC INTERESTERIFICATION

Cost-effective when running continuously on 'clean' bulk fat

Simple, clean & safe - 'Natural' process

No side reactions, no supplementary post-bleaching

Lower capital investment cost compared to chemical process

## - ENZYMATIC INTERESTERIFICATION

Sensitive & costly catalyst (temp, moisture PV, gums, impurities)

Less easy stock-change (cross-contamination)

To certain extent triglyceride composition dependent

New & still rather unknown

# Investment and operating cost - A comparison

Cost in US\$/ton	Chemical IE	Enzymatic IE	Hydro
Investment cost	6.5	3.7	9.0
Operating cost	21.0	34.7	48.7
Oil losses	10.5	2.3	0.7
Total costs	38.0	40.8	58.4
